IMMUNOLOGY

Test	Result	Flag	Unit	Reference Range	Methodology
HEPATITIS B SURFACE ANTIBODY (HBSAB)	203		mIU/mL	Non-Reactive / Not Immune:<10 Reactive/Immune: General population: = or > 10 High Risk Professions: = or > 100	CLIA

Interpretation Notes :

Interpretation:

Non-reactive results indicate inability to determine if Anti-HBs is present at levels consistent with recovery or immunity. Repeat testing is recommended in 1 to 3 months.

Reactive result indicates recovery from acute or chronic Hepatitis B virus (HBV) infection or acquired immunity from HBV vaccination.

HEPATITIS C ANTIBODIES	0.04		S/CO	Non-reactive: < 1.0 Reactive: =/> 1.0 Please note change in unit.	CLIA
------------------------	------	--	------	---	------

Interpretation Notes :

A non-reactive screening test result does not exclude the possibility of exposure to or infection with HCV. Non-reactive screening results in individuals with prior exposure to HCV may be due to low antibody levels that are below the limit of detection of this assay or lack of reactivity to the HCV antigens used in this assay. Patients with acute or recent HCV infections (< 3 months from time of exposure) may have false-negative HCV antibody results due to the time needed for seroconversion (average of 8 - 9 weeks). Testing for HCV RNA and or RIBA is recommended.

A repeatedly reactive screening result is consistent with current HCV infection, or past HCV infection that has resolved, or biologic false positivity for HCV antibody. Testing for HCV RNA and or RIBA is recommended
