INTERPRETATION NOTES :

Test Information: This is an in vitro Real Time multiplex PCR test intended for the qualitative detection of nucleic acid from various bacterial and fungal pathogens from genital swab and urine samples from patients suspected of having sexually transmitted infection.

A. "DETECTED" result indicates the presence of microbial infection. Clinical correlation is required for further follow-up.

B. "NOT DETECTED" result indicates the absence of microbial infection.

Limitation of Assay:

- This test is a qualitative assay; results are reported either as detected or not detected for sexually transmitted infection.
- False negative results may be caused by unsuitable collection, handling and/ or storage of specimen.
- A negative result for any PCR test does not conclusively rule out the possibility of infection.

Reference: Kit Insert (Vision Biotechnology).

Sample Type : URINE / PCR SWAB
