

# **Laboratory Investigation Report**

Name : Ms. SANAYA KHAN MOSHIN KHAN

 DOB
 : 22/12/2016

 Age / Gender
 : 8 Y / Female

 Referred by
 : Dr. BUSHRA

Centre : CITICARE MEDICAL CENTER

**Ref No.** : 45566

**Sample No.** : 2501526803

**Collected** : 17/01/2025 19:45

**Registered** : 18/01/2025 16:16 **Reported** : 18/01/2025 18:23

## **BIOCHEMISTRY**

Test Result Flag Unit Reference Range Methodology

ALT / SGPT 17 U/L < or = 35

Please note change. Source: Roche IFU.

#### **INTERPRETATION NOTES:**

High levels of ALT may be due to liver damage from conditions such as hepatitis or cirrhosis, lead poisoning, very strenuous exercise or severe injury to a muscle, exposure to carbon tetrachloride, decay of a large tumor (necrosis), mononucleosis, and growth spurts.

Low levels of ALT may be due to low-functioning or non-functioning liver, urinary tract infections, or malnutrition.

C-REACTIVE PROTEIN (CRP) 15.6 CH mg/L < 5.0 Particle-enhanced

Please note change.

Source: Roche IFU.

immunoturbidimetric assay

#### **INTERPRETATION NOTES:**

- 1. CRP measurements are used as aid in diagnosis, monitoring, prognosis, and management of suspected inflammatory disorders and associated diseases, acute infections and tissue injury.
- 2. C-reactive protein is the classic acute phase protein in inflammatory reactions.
- 3. CRP is the most sensitive of the acute phase reactants and its concentration increases rapidly during inflammatory processes. The CRP response frequently precedes clinical symptoms, including fever. After onset of an acute phase response, the serum CRP concentration rises rapidly and extensively. The increase begins within 6 to 12 hours and the peak value is reached within 24 to 48 hours. Levels above 100 mg/L are associated with severe stimuli such as major trauma and severe infection (sepsis).
- 4. CRP response may be less pronounced in patients suffering from liver disease.
- 5. CRP assays are used to detect systemic inflammatory processes (apart from certain types of inflammation such as systemic lupus erythematosus (SLE) and Colitis ulcerosa); to assess treatment of bacterial infections with antibiotics; to detect intrauterine infections with concomitant premature amniorrhexis; to differentiate between active and inactive forms of disease with concurrent infection, e.g. in patients suffering from SLE or Colitis ulcerosa; to therapeutically monitor rheumatic disease and assess anti-inflammatory therapy; to determine the presence of post-operative complications at an early stage, such as infected wounds, thrombosis and pneumonia, and to distinguish between infection and bone marrow transplant rejection.

Sample Type : Serum
