**INTERPRETATION:**

A "DETECTED" result indicates the presence of microbial infection. Clinical correlation is required for further follow-up.

A "NOT DETECTED" result indicates the absence of microbial infection

**Limitation of Assay:**

- Interfering substances may affect the accuracy of this assay; results should always be interpreted in conjunction with clinical and epidemiological findings.
- The detection limit for this assay is 50 copies/reaction. False-negative results may occur due to sequence variability underlying the primers and probes, or the presence of the organism in quantities below the limit of detection of the assay.
- This test is a qualitative assay; results are reported either as negative or positive for STD infection.
