Date:27/07/2025	Patient Name: ANAND SINGH	Patient ID: 41910
Gender: M	Age: 48Y	Ref Physician : DR. AISHA

Abdominal and Pelvis Ultrasonography Examination

- The liver is normal in size and parenchymal echogenicity. Intrahepatic and extrahepatic biliary ducts are normal, no evidence of mass lesion.
Right lobe- 139mm (N= 120-160mm) Left lobe- 78mm (N= 100 mm)
- The gallbladder is fairly-distended and appears normal in size. There are multiple varying sizes (maximum=17mm) echogenic foci having posterior acoustic shadows within the gallbladder. No evidence of wall thickening, polyp or pericholecystic fluid collection.
- Pancreas is normal in size with homogenous parenchymal echotexture, no evidence of calcification, focal lesion or peripancreatic fluid collection.
- Spleen is normal in size with homogenous parenchymal echotexture, no evidence of mass lesion.
- Both kidneys are normal in location, size and parenchymal echogenicity. Cortico-medullary differentiation is preserved, perinephric planes appear normal, no evidence of mass lesion. There are 3mm in sizes non-obstructive stones in both kidneys.
Right kidney- 100x42mm (cortex- 16mm)
Left kidney - 104x49mm (cortex-16mm)
- The urinary bladder is not full (69ml), wall thickness is normal, no evidence of diverticule or abnormal mass lesion in the wall and within the urinary bladder. No calculi seen.
- The prostate gland is mildly large in size (41x41x41mm, volume=37ml), no evidence of mass lesion.
- No evidence of free fluid within the abdominal cavity and pelvic region.
- No evidence of bowel wall thickening, intussusceptions or any sign for acute appendicitis in this examination.

IMPRESSION:

- There are multiple varying sizes (maximum=17mm) echogenic foci having posterior acoustic shadows within the gallbladder (cholecystolithiasis).
- There are 3mm in sizes non-obstructive stones in both kidneys.
- The prostate gland is mildly large in size (41x41x41mm, volume=37ml), suggestive of mild prostate gland hyperplasia.
