- It has been found that may serotypes of Salmonella possess somatic antigens of the same kind. Therefore, agglutination of any of the Salmonella antigens with human serum should not be taken as proof of infection by one particular organism, but rather infection by an organism of a like antigenic structure.
- Test should be read after the recommended incubation time to eliminate the possibility of false results.
- Many populations or communities can show high levels of residual antibodies often in excess of 1/180-1/160. Patients can also show high level of residual antibodies from previous infections or immunization.
- For a test to be of clinical significance a rise in titre must be demonstrated not just a high titre for a one off test. Chronic liver disease has also shown to cause a rise in Salmonella antibody titre.
